
PROJECT OVERVIEW & COSTING

AI Safety Council

Project Overview, Features & Costing

A Plain-Language Guide for Stakeholders

Certified AI Practitioner for OSH (AI-OSH)

AI Safety Council — Project Overview, Features & Costing

Platform: AI Safety Council — Certified AI Practitioner for Occupational Safety & Health (AI-OSH) **What this document is:** A plain-language overview of what we're building, what it costs to build, what it costs to run each month, and how it grows. **Date:** 01 July 2026

Money note: All figures in Indian Rupees (₹). Where we use online tools priced in US dollars, we've converted at about ₹86 to \$1. "Lakh" = ₹1,00,000. Taxes (like GST) are extra where they apply.

1. In Short

We're building the **AI Safety Council** — an online learning platform that teaches safety professionals how to use AI in their work. This is the first step of a bigger vision, but for now we're building a clean, professional platform where students take courses, complete tests, and earn a certificate.

A few deliberate choices make this platform feel exclusive and trustworthy:

- **No public sign-up.** Students can't register themselves. The admin creates each student's account and hands them their login. This keeps the course invitation-only and adds to its value.
- **No online payment.** Students pay the admin directly (offline). The admin then creates their account. This keeps things simple and makes the certificate feel earned, not just bought.
- **Protected content.** Videos and materials are locked down as much as is realistically possible, and every student's materials are watermarked with their name so leaks can be traced (more in Section 6).

The headline numbers:

- **To build it: ₹1,20,000** (one-time). This does not include the monthly running costs. Full breakdown in Section 9.
- **To run it each month:** roughly ₹5,700–7,400, and this barely changes as you grow from 100 students to 10,000 (Section 11).
- **How it's built:** in six clear phases, each ending in a milestone you can see and check. The exact schedule will be agreed together (Section 14).

2. Who It's For

The students: Safety professionals — Safety Officers, HSE Engineers and Managers, Consultants, Trainers, Auditors, and EHS Leaders. They want to learn AI skills that make their work faster and better, and earn a certificate that proves it.

The admin (you / the course owner): The person who runs everything — adds courses, creates student accounts, checks and grades submitted work, and hands out certificates.

3. What We're Building

The public website (open to everyone):

- A **home page** that explains why a safety professional should learn AI.
- An **About page** and a **Contact page** (with a form that emails you).

The private learning area (only for logged-in students):

- A personal dashboard showing the courses assigned to them and how far along they are.
- The course itself: short video lessons, reading notes, and downloadable worksheets.
- Two kinds of tests (Section 4).
- Their certificate, once earned.

The admin control panel (only for you):

- Add and edit courses, one at a time or in bulk.
- Create student accounts and assign courses to them.
- Review and grade submitted work.
- Upload and issue certificates.

The design: the look and feel is built from a **ready-made, professional HTML template customized to your branding** — a faster, lower-risk approach than designing every screen from scratch.

4. The Features, Explained Simply

Course content. Each course is made of sections ("modules"), and each module has several short lessons (8–15 minutes each). A lesson has a video, some reading notes, and worksheets to download.

Two types of tests:

1. **Multiple-choice quiz** — the student picks answers, and the system marks it instantly and shows the score.
2. **Upload-your-work test** — the student uploads a PDF (for example, a completed exercise). This goes to the admin to review and grade. **Importantly, the student does not have to wait** — they can keep going through the course while it's being graded.

Certificates. When a student finishes a course, the admin uploads their certificate. Within 24 hours the student gets it three ways: **by email, inside their dashboard** (to view and download), and a **"Share to LinkedIn"** button so they can add it to their profile.

Adding course content in bulk. Instead of typing every lesson in by hand, the admin can fill in a ready-made template, zip it up, and upload it once — and the whole course is built automatically. This is explained simply in Section 7.

5. How People Use It

You (admin) set up a course: Fill in the course template → upload it → the system builds the whole course → you review a simple report and fix anything flagged → publish it.

You (admin) enrol a student: Student pays you directly → you create their account → assign the course → they're emailed their login.

A student takes a course: Log in → open their course → watch lessons (progress is saved automatically) → take the quiz (marked instantly) → upload their exercise (keep going, no waiting) → finish → certificate

arrives within 24 hours → view it, download it, or share to LinkedIn.

6. Content Protection — What's Realistic

You asked for the platform to be fully protected from downloads and screenshots. Here's the honest picture, because it matters:

The honest truth: No website in the world can fully stop screenshots or screen recording — not Netflix, not Udemy. Screenshots are controlled by the viewer's own computer or phone, not by the website. Someone can always take a screen photo with a second phone. Anyone who promises "100% screenshot-proof" on a website isn't being straight with you.

What we *will* do (and it's genuinely strong):

- **Videos on a protected player (Vimeo)** — the video will only play on your website (it won't work if the link is copied elsewhere), and the download button is switched off.
- **Watermarking — the most important protection.** Every student's **name and email are faintly stamped across the videos and PDFs**. This doesn't stop a screenshot, but it means **any leaked screenshot or recording can be traced straight back to the person who leaked it**. This is the real deterrent, and it's how professional training platforms handle it.
- **Temporary secure links** — materials open through links that expire and are tied to the logged-in student, so a link can't simply be shared or saved.
- **Download and right-click switched off** across videos and notes.
- **Everything locked behind login** — nothing is visible unless a student is logged in and enrolled.

Bottom line: casual copying and sharing are blocked, and anyone who does manage to leak something is identifiable. That's the realistic, professional standard.

7. How Bulk Course Upload Works (in plain terms)

The concern with bulk upload is always the videos — they're huge, and trying to upload gigabytes of video in one go is what breaks. **So we keep the videos out of the upload entirely.** Everything else in a course (lesson titles, notes, worksheets) is tiny.

Here's the flow:

1. We give you a **ready-made template folder** shaped like a course — a folder for each module, a spot for the notes and worksheets in each lesson, and a simple list where you paste each lesson's **video link**.
2. You fill it in, zip it, and upload. Because there are no videos inside, it's only a few megabytes and **uploads in seconds**.
3. The system reads it and **builds the whole course automatically** — all modules, lessons, notes, worksheets, and video links in place.
4. It shows you a **plain report**, e.g. *"Built 8 modules, 40 lessons, 35 worksheets. 2 things to check: one lesson has no video link; one worksheet wasn't a PDF."*
5. You fix those couple of items by hand in the editor. Done.

The video links come from **Vimeo**: you upload each lesson's video to your Vimeo account, it gives you a link, and you paste that link into the template. Nothing is ever silently lost, and the manual editor is always there as a safety net.

8. How Big Is a Course? (a rough guide)

- A typical course is about **8 hours of video**, spread across roughly **40 short lessons**.
- **The videos live on Vimeo, not on your platform.** A full course's videos are about **6–8 GB** — and Vimeo's plan comfortably holds **many courses' worth** (well over 100 hours).
- **The documents** (notes + worksheets) that live on your own platform are **tiny — usually under 100 MB per course**.
- **The bulk-upload file** (no videos inside) is just **a few megabytes** — which is exactly why it uploads instantly and reliably.
- **Practical tip:** keep each video at normal quality (720p/1080p) so files stay reasonable, and keep worksheets as PDFs.

In short: your platform itself stays small and cheap to run because the heavy videos are handled by Vimeo.

9. What It Costs to Build — ₹1,20,000

We justify this three ways: the **work involved**, a **price per feature**, and a **comparison to the market**.

9.1 The work involved (two developers)

Part of the work	Effort (working days)
Setup and groundwork	4
Public website (Home / About / Contact)	5
Secure login for students and admin	4
Admin: build and edit courses by hand	7
Admin: bulk course upload	6
Student learning area (dashboard, lessons, progress)	8
The two test types (quiz + upload-and-grade)	6
Certificates (upload, email, LinkedIn, download)	3
Content protection (Vimeo, watermarking, secure links)	4
Creating student accounts and assigning courses	2.5
Testing, fixing, launch, and training you to use it	5
Total	~54 working days

(These are "one person, one full day" units of effort — a measure of the work involved, not a delivery schedule. The design is customized from a ready-made template, which keeps the website effort down. The schedule is agreed separately, Section 14.)

9.2 Price per feature (adds up to ₹1,20,000)

Deliverable	Price (₹)
Setup and groundwork	8,000
Public website	12,000
Secure login	12,000
Admin course builder (by hand)	16,000
Bulk course upload	14,000
Student learning area	18,000
The two test types	14,000
Certificates	8,000
Content protection & watermarking	8,000
Student account management	5,000
Testing, launch, handover & training	5,000
Total	1,20,000

9.3 Compared to the market

If you hired...	It would typically cost
Freelance developers (per this much work)	₹2,00,000 – ₹3,50,000
A small development agency	₹5,00,000 – ₹7,50,000
This project	₹1,20,000 (fixed) — a fully-custom platform you own outright

In plain terms: you're getting a custom-built platform that you fully own — no monthly "per student" fees to a course provider — for **less than half** of what the market normally charges.

10. Payment Schedule

The ₹1,20,000 is paid in four parts, each tied to a clear, visible milestone.

#	When	What's done	Share	Amount (₹)
1	At the start	Project kicked off, access & materials shared	30%	36,000
2	Milestone 3 done	Bulk upload works + student accounts working	30%	36,000
3	Milestone 5 done	Both test types + certificates working	25%	30,000
4	At launch	Live, tested, and handed over	15%	18,000
		Total	100%	1,20,000

The monthly running costs (Section 11) are separate and paid to the service providers directly.

11. Monthly Running Cost

Once live, the platform runs on a handful of low-cost online services. Here's the monthly bill and — importantly — **why it barely grows as you add students**.

Please note: all figures below are **rough estimates**. Actual bills depend on the exact plans chosen, usage, and any price changes by the service providers. Treat them as a reliable ballpark, not fixed quotes.

What it's for	Service	Monthly (₹)
Website hosting	Vercel	~1,720
Database + logins	Supabase	~2,150
File storage (notes, worksheets, certificates)	Cloudflare	~10–120
Video hosting + protection	Vimeo	~1,700
Sending emails	Email service	₹0 (free at first) → ~1,720
Website address (domain)	—	~90
Total		~₹5,700 – 7,400 / month

Why it stays flat: the heavy part (videos) sits on Vimeo for one flat fee, and your own platform only stores small documents. So going from 100 students to 10,000 barely moves the bill.

Number of students	Monthly running cost
Up to 1,000	~₹5,700
1,000 – 5,000	~₹6,500
5,000 – 10,000	~₹7,400

That's roughly **₹68,000 – ₹89,000 per year**, no matter how much you grow within that range.

12. As You Grow — What Changes

The monthly cost hardly moves, but the way you run things should mature a little as more students join:

Stage	Students	Monthly cost	What to add at this stage
Launch	up to 500	~₹5,700	Just get going. Turn on automatic backups.
Growing	500 – 1,000	~₹5,700	Add a "test copy" of the site for safely trying changes; basic alerts if the site goes down.
Scaling	1,000 – 5,000	~₹6,500	Add automatic error alerts; upgrade the email plan for volume.
Large	5,000 – 10,000	~₹7,400	Give the database a small power boost for smooth performance.
Very large	10,000+	~₹10,000+	Add extra database capacity and closer monitoring.

The big picture: going from 100 to 10,000 students only takes the bill from about ₹5,700 to ₹7,400 a month — a small increase for a hundred times the students. That's the advantage of how this is built.

13. After Launch — Support

Free for the first 30 days: we fix any bugs in what we delivered, at no charge.

Optional maintenance (after that) — pay monthly or yearly:

Plan	Per month (₹)	Per year (₹)	What you get
Basic	2,000	24,000	Security updates, bug fixes, keeping an eye on uptime, email support, small tweaks (about 4 hours a month).
Standard	3,500	42,000	Everything in Basic, plus small improvements, priority support, and a monthly check-in (about 8 hours a month).
One-off changes	—	Quoted	New features billed per request, around ₹3,000–₹5,000 a day, or a fixed quote.

(The yearly rate works out slightly cheaper than paying month-to-month. These are rough estimates and can be adjusted to what you actually need.)

14. Delivery Milestones

The build is delivered in six phases, each ending in a milestone you can log in and check. Three of these trigger a payment (Section 10). **The exact schedule will be agreed together separately** — this section is about the *order* and *what each milestone delivers*, not dates.

Milestone	What's working by then	Payment
M1	Groundwork + public website	—
M2	Logins working + admin can build a course by hand	—
M3	Bulk upload + student accounts	Payment 2
M4	Students can learn, with protected video	—
M5	Both test types + certificates	Payment 3
M6	Tested, protected, and live	Payment 4

Each milestone is small and visible, so progress is always clear.

15. Assumptions & What's Not Included

We're assuming:

- Videos are hosted on Vimeo (paid plan); the platform stores only documents.
- About 3–4 courses to start, roughly 8 hours of video each.
- The monthly service costs are paid by you, directly to the providers.
- The visual design starts from a ready-made HTML template, customized to your branding (not designed screen-by-screen from scratch).

Not included now (planned for later phases):

- Community/discussion area, a shared prompt library, AI tools, a corporate-training portal, online payments, and a mobile app. The platform is built so these can be added later without starting over.

Worth keeping in mind:

- Bulk upload is the trickiest piece — a clear, agreed template keeps it reliable (Section 7).
- Emails need a properly set-up sender address so certificates don't land in spam.

16. Our Recommendations

1. **Go ahead with the platform as described** — it's a strong, professional foundation.
2. **Use Vimeo for video plus watermarking** — realistic, strong protection with little extra work.
3. **Budget about ₹5,700–7,400 a month** to run it, at any size up to 10,000 students.
4. **Pay across four milestones** tied to visible progress; the exact schedule is agreed separately.
5. **Keep the extra "ecosystem" features for later** to protect your time and budget now.
