
PROJECT & DELIVERY HANDBOOK

AI Safety Council

Project & Build Handbook

Overview, Features & Delivery Plan — Team Reference

Certified AI Practitioner for OSH (AI-OSH)

AI Safety Council — Project & Build Handbook

Platform: AI Safety Council — Certified AI Practitioner for Occupational Safety & Health (AI-OSH) **What this is:** One combined reference for the team building the platform — the project overview, the features, and the full build plan in a single document. **Date:** 01 July 2026

Money note: Only the ongoing monthly running costs are covered here (the services the live platform needs). All figures are in Indian Rupees (₹), converted from US-dollar service prices at about ₹86 to \$1, and are **rough estimates**.

1. In Short

We're building the **AI Safety Council** — an online learning platform that teaches safety professionals how to use AI in their work. Students take courses, complete tests, and earn a certificate.

A few deliberate choices make the platform feel exclusive and trustworthy:

- **No public sign-up.** Students can't register themselves. The admin creates each student's account and hands them their login — keeping it invitation-only.
- **No online payment.** Students pay the admin directly (offline); the admin then creates their account. Simple, and it makes the certificate feel earned.
- **Protected content.** Videos and materials are locked down as much as is realistically possible, and each student's materials are watermarked with their name so leaks can be traced (Section 6).

Key points:

- **How it's built:** in six clear phases, each ending in a milestone you can see and check.
- **The design:** built from a ready-made, professional HTML template customized to the branding — not designed from scratch.
- **To run it each month:** roughly ₹5,700–7,400, and this barely changes as you grow from 100 students to 10,000 (Section 10).

2. Who It's For

The students: Safety professionals — Safety Officers, HSE Engineers and Managers, Consultants, Trainers, Auditors, and EHS Leaders. They want AI skills that make their work faster and better, plus a certificate that proves it.

The admin (course owner): Runs everything — adds courses, creates student accounts, checks and grades submitted work, and hands out certificates.

3. What We're Building

The public website (open to everyone):

- A **home page** explaining why a safety professional should learn AI.

- An **About page** and a **Contact page** (with a form that emails the admin).

The private learning area (only for logged-in students):

- A personal dashboard showing assigned courses and progress.
- The course itself: short video lessons, reading notes, downloadable worksheets.
- Two kinds of tests (Section 4).
- Their certificate, once earned.

The admin control panel (only for the admin):

- Add and edit courses, one at a time or in bulk.
- Create student accounts and assign courses.
- Review and grade submitted work.
- Upload and issue certificates.

The design: the look and feel is built from a **ready-made, professional HTML template customized to the branding** — a faster, lower-risk approach than designing every screen from scratch.

4. The Features, Explained Simply

Course content. Each course has sections ("modules"), and each module has several short lessons (8–15 minutes). A lesson has a video, reading notes, and worksheets to download.

Two types of tests:

1. **Multiple-choice quiz** — the student picks answers; the system marks it instantly and shows the score.
2. **Upload-your-work test** — the student uploads a PDF; it goes to the admin to review and grade. **The student does not wait** — they can keep going while it's being graded.

Certificates. When a student finishes a course, the admin uploads their certificate. Within 24 hours the student gets it three ways: **by email**, **inside their dashboard** (to view/download), and a **"Share to LinkedIn"** button.

Adding course content in bulk. Instead of typing every lesson by hand, the admin fills a ready-made template, zips it, and uploads it once — the whole course is built automatically (Section 7).

5. How People Use It

Admin sets up a course: Fill in the course template → upload → the system builds the whole course → review a simple report and fix anything flagged → publish.

Admin enrolls a student: Student pays the admin directly → admin creates their account → assigns the course → they're emailed their login.

A student takes a course: Log in → open their course → watch lessons (progress saved automatically) → take the quiz (marked instantly) → upload their exercise (keep going, no waiting) → finish → certificate arrives within 24 hours → view, download, or share to LinkedIn.

6. Content Protection — What's Realistic

The honest truth: No website in the world can fully stop screenshots or screen recording — not Netflix, not Udemy. Screenshots are controlled by the viewer's own device, not the website. Someone can always photograph the screen with a second phone. Anyone promising "100% screenshot-proof" on a website isn't being straight.

What we *will* do (and it's genuinely strong):

- **Videos on a protected player (Vimeo)** — the video only plays on your website (a copied link won't work elsewhere), and the download button is switched off.
- **Watermarking — the most important protection.** Every student's **name and email are faintly stamped across the videos and PDFs**. It doesn't stop a screenshot, but **any leak can be traced straight back to the person who leaked it**.
- **Temporary secure links** — materials open through links that expire and are tied to the logged-in student, so a link can't simply be shared or saved.
- **Download and right-click switched off** across videos and notes.
- **Everything locked behind login** — nothing is visible unless a student is logged in and enrolled.

Bottom line: casual copying and sharing are blocked, and anyone who does leak something is identifiable.

7. How Bulk Course Upload Works

The concern with bulk upload is always the videos — they're huge, and uploading gigabytes at once is what breaks. **So we keep the videos out of the upload entirely.** Everything else in a course is tiny.

1. We provide a **ready-made template folder** shaped like a course — a folder per module, a spot for notes and worksheets in each lesson, and a list to paste each lesson's **video link**.
2. Fill it in, zip it, upload. With no videos inside, it's only a few megabytes and **uploads in seconds**.
3. The system reads it and **builds the whole course automatically** — modules, lessons, notes, worksheets, and video links.
4. It shows a **plain report**, e.g. *"Built 8 modules, 40 lessons, 35 worksheets. 2 things to check: one lesson has no video link; one worksheet wasn't a PDF."*
5. Fix those couple of items by hand in the editor. Done.

The video links come from **Vimeo**: upload each lesson's video to the Vimeo account, it gives a link, paste that into the template. Nothing is ever silently lost, and the manual editor is always the safety net.

8. How Big Is a Course?

- A typical course is about **8 hours of video** across roughly **40 short lessons**.
- **Videos live on Vimeo, not on your platform.** A course's videos are about **6–8 GB** — Vimeo's plan holds many courses' worth (well over 100 hours).
- **Documents** (notes + worksheets) on your own platform are **tiny — usually under 100 MB per course**.
- **The bulk-upload file** (no videos inside) is just **a few megabytes** — which is why it uploads instantly and reliably.
- **Tip:** keep each video at normal quality (720p/1080p) and worksheets as PDFs.

In short: the platform itself stays small and cheap to run because Vimeo handles the heavy videos.

9. Work Breakdown (Effort)

A view of the work involved, to help split it across the two developers. (*Effort units — "one person, one full day" — not a schedule.*)

Part of the work	Effort (working days)
Setup and groundwork	4
Public website (Home / About / Contact, from template)	5
Secure login for students and admin	4
Admin: build and edit courses by hand	7
Admin: bulk course upload	6
Student learning area (dashboard, lessons, progress)	8
The two test types (quiz + upload-and-grade)	6
Certificates (upload, email, LinkedIn, download)	3
Content protection (Vimeo, watermarking, secure links)	4
Creating student accounts and assigning courses	2.5
Testing, fixing, launch, and admin training	5
Total	~54 working days

10. Monthly Running Cost

Once live, the platform runs on a handful of low-cost online services.

Please note: these are **rough estimates**. Actual bills depend on the exact plans chosen, usage, and any price changes by the providers.

What it's for	Service	Monthly (₹)
Website hosting	Vercel	~1,720
Database + logins	Supabase	~2,150
File storage (notes, worksheets, certificates)	Cloudflare	~10–120
Video hosting + protection	Vimeo	~1,700
Sending emails	Email service	₹0 (free at first) → ~1,720
Website address (domain)	—	~90
Total		~₹5,700 – 7,400 / month

Why it stays flat: the heavy part (videos) sits on Vimeo for one flat fee, and your own platform only stores small documents. Going from 100 to 10,000 students barely moves the bill.

11. As You Grow — What Changes

The monthly cost hardly moves, but how you run things should mature a little as more students join:

Stage	Students	Monthly cost	What to add
Launch	up to 500	~₹5,700	Get going. Turn on automatic backups.
Growing	500 – 1,000	~₹5,700	Add a "test copy" of the site; basic down-alerts.
Scaling	1,000 – 5,000	~₹6,500	Automatic error alerts; upgrade email for volume.
Large	5,000 – 10,000	~₹7,400	Small database power boost for smooth performance.
Very large	10,000+	~₹10,000+	Extra database capacity and closer monitoring.

Going from 100 to 10,000 students only takes the bill from about ₹5,700 to ₹7,400 a month — a small rise for a hundred times the students.

12. Support

- **Free for the first 30 days** after launch: any bugs in what was delivered are fixed at no charge.
- **Ongoing maintenance** (security updates, bug fixes, small improvements) is available afterwards as needed.

13. Delivery Milestones

The build is delivered in six phases, each ending in a milestone that can be logged in and checked. This is about the *order* and *what each milestone delivers* — the exact schedule is agreed separately.

Milestone	What's working by then
M1	Groundwork + public website
M2	Logins working + admin can build a course by hand
M3	Bulk upload + student accounts
M4	Students can learn, with protected video
M5	Both test types + certificates
M6	Tested, protected, and live

14. How We're Working (Build Plan)

- **Two developers**, splitting the work into a **"behind-the-scenes" lead** (the engine, database, uploads, tests, certificates) and a **"screens" lead** (everything the student and admin see and click). They pair up on the tricky join points.
- We build in a **sensible order** so nothing is blocked waiting on something else.
- After each milestone, you can log in and see real, working progress.
- **The look and feel starts from a ready-made HTML template**, customized to the branding — keeping the visual work fast and letting effort go into the features that matter.

15. Build Sequence

#	Phase	What gets built	Ends in
1	Groundwork + public website	Project setup, login foundation, and the Home / About / Contact pages (from the customized template).	M1
2	Logins + admin course builder	Full logins; admin tools to build and edit courses, modules, and lessons by hand.	M2
3	Bulk upload + student accounts	Bulk course upload (template → upload → course built → report to fix); create and enrol students.	M3
4	Learning area + protected video	Student dashboard and course player; protected Vimeo video connected.	M4
5	Tests + certificates	Multiple-choice quiz, upload-and-grade test, and certificates (email + dashboard + LinkedIn).	M5
6	Protection, testing & launch	Watermarking, download lockdown, full testing, go-live, and training.	M6

16. What Happens in Each Phase

Phase 1 — Groundwork + Public Website

Set up the project, database, and tools; build the secure login foundation; build the public Home/About/Contact pages by customizing the template (contact form emails the admin). **Milestone 1:** public website live on a test link.

Phase 2 — Logins + Admin Course Builder

Finish logins (student login, admin login, first-time password change); build admin tools to create/edit courses, modules, and lessons by hand — the safety net for fixing anything later. **Milestone 2:** both logins work; admin can build a course manually.

Phase 3 — Bulk Upload + Student Accounts

Build the bulk course upload (fill template → upload → course built → simple report of anything to fix); build admin tools to create student accounts and assign courses. **Milestone 3:** bulk upload works; students can be created and enrolled.

Phase 4 — Learning Area + Protected Video

Build the student dashboard and course player (video + notes + worksheets, progress saved automatically); connect the protected Vimeo video so it only plays inside the platform. **Milestone 4:** a student can log in and go through a course.

Phase 5 — Tests + Certificates

Build the multiple-choice quiz (marks itself); the upload-your-work test (student uploads a PDF, admin grades it, student keeps going meanwhile); certificates (admin uploads → email + dashboard + Share to LinkedIn). **Milestone 5:** both test types and certificates work end to end.

Phase 6 — Protection, Testing & Launch

Add watermarking (student name/email on videos and PDFs); lock down downloads and links; test thoroughly (phones + browsers); go live; set up the proper email sender; train the admin. **Milestone 6:** live, protected, handed over.

17. The Order Matters — Why It's Sequenced This Way

1. **Logins and the database come first** — everything sits on top of them.
 2. **The manual course builder comes before bulk upload** — bulk upload fills in the same course structure, so that has to exist first.
 3. **Video protection depends on the learning area** being in place.
 4. **Certificates and emails come near the end**, once students and courses exist.
 5. **The bulk-upload template is agreed before that phase** — the single most important thing to lock early.
-

18. What We Need (to avoid delays)

Stage	What's needed
Before we start	Website address (domain), logo, the words for Home/About/Contact, and the HTML template to use (or we recommend one).
Before bulk upload	Agreement on the bulk-upload template , and one real sample course to test with.
Before tests & certificates	Certificate design, a sample quiz, and a sample "upload" exercise.
Near launch	Time for training and a final review before going live.

19. Risks & How We Handle Them

Risk	How we handle it
Bulk upload is fiddly	Keep videos out of it; agree a clear template; always show a report and allow manual fixes.
People copying content	Vimeo protected player + watermarking + login-locked, expiring links.
Certificate emails going to spam	Set up a proper verified sender address early.
Losing track of progress	Milestones are small and visible, so we always know where we stand.
Trying to add too much	Extra features (community, prompt library, etc.) are kept for later.

20. Not in This Build (Saved for Later)

Community/discussion area, shared prompt library, AI tools, corporate-training portal, online payments, and a mobile app. The platform is built so these can be added later without redoing the foundation.
